

# Generitrack - Enterprise

A unique item tracking system for Assets tracking and Check out/in transactions.

Used for tracking unique items such as fixed assets, IT assets, files, tapes, tools, packages, equipment and anything that is unique, has an owner a storage location and is likely to move or be issued. Supplied either as a web hosted application or as an installable application, in either case Generitrack runs in a web browser.

The real benefit of Generitrack is accessibility. Running in a web browser makes Generitrack easy to deploy without the need to spec pc's or consider the implications of installing yet another application on each user pc.

Generitrack presents the enterprise with the benefits of a generic tracking system that can evolve to suit their needs. Start with the basic, unique asset tracking system and add customer requests/orders and further add cost tracking for chargeable items such as file storage rental.

Generitrack is fully configured for running remotely on a mobile data collector with either a barcode or RFID reader built in. Use of a mobile data collector is seamless, using either a local wireless network connection or a GPRS connection to a web server. Generitrack mobile data collectors are fitted with both WiFi and GPRS cards allowing seamless updating of the host data (note the GPRS card excludes the supply of a sim card and data service)

**Generitrack** is a full function item tracker which tracks unique items such as assets, IT assets, files, unique stock issued to users and similar tasks.

Unique items are tracked with attributes such as unique item number, owner, location and movement, History and many other features. Generitrack allows a unique item to have a child to parent relationship which is particularly used in IT asset tracking in which a pc box has a number of unique accessories but is equally useable in any situation such as file tracking, where a file belongs to a storage box. Loan and issuing control allows an item to be booked out for a set period of time and tracked if the time is exceeded. Full flexible reporting across all attributes allows full data management and item traceability.

Being built on a generic platform our product is adaptable to almost any unique item tracking task. As an administrator and the with the feature implemented, you can set up and manage third party users such as customers who need to view their unique data, even request an action such as deliver file n to location x

Generitrack cost tracking, for example allows a charge per file per day, or per file movement. Items delivered by Generitrack assisted drivers gives the option to include GPS tracking of vehicle movement.

Generitrack is ideally suited to sharing data with other systems either by data export or via web services. For example an asset list with age and value at time of creation could be shared with an enterprise accounts management system.

Generitrack is used by Enterprises with distributed staff and offices and SME's alike because of its unique accessibility and easy start up.
